

Preliminary setup: No problems, everything worked from the getgo.

- 1) Creating Users
 - a. All users were successfully created, and all errors/invalid input were reported and not inserted into the database.
- 2) Logging In
 - a. All users could log in and invalid input resulted in an error screen.
- 3) Adding Facilities
 - a. All facilities were adding correctly into the database, all duplicate entries threw error pages.
- 4) Adding Assets
 - a. All assets were correctly added into the database, and the duplicate entry threw the error page.
- 5) Asset Disposal
 - a. All user role validation worked correctly
 - b. All asset disposals worked correctly, with disposed assets being recorded in the database as disposed
- 6) Transfer Process
 - a. All user role validation worked correctly
 - b. All request timelines worked correctly (could not load/unload before previous timestamps)
 - c. There was no error page presented for incorrect timestamp validation (this could be on purpose, I don't think this was necessary in the guidelines but I could be wrong)
- 7) Reports
 - a. All reports were functional and reported the correct data at the correct times.
- 8) Database queries
 - a. All database queries reported the appropriate data as per the test document.

Extra test feedback:

- All functionality worked 100%
- All role validation worked 100%
- As indicated in 6c, maybe put in an error page when the time is not submitted correctly. Other than that, looks really good and is completely functional. Good work!
